

**Protect absorptive materials that are stored on-site and during installation from contamination and moisture damage.**

These insulation materials are stored properly. They are wrapped and off the floor on pallets.

Materials are wrapped however there is a box sitting on top, so this is not ideal.

Not in protective packaging and dirty. These materials are contaminated.

Insulation is wrapped but dust can get through porous covering.

**Absorptive building materials such as porous insulation, wood, gypsum wallboard, should be kept dry to prevent the growth of mold and bacteria. Cover these materials to prevent water damage, contamination from dirt/debris, and store raised from the ground. Do not stack other materials on top. During installation, minimize the time material is in contact with floor or other porous materials. Immediately remove materials that show signs of mold and mildew or moisture stains.**
