

Masonry will expand with moisture in both directions. The masonry wall anchors are designed to accommodate the up & down movement in the wall system.

The placement of the wire tie in the wall anchor will impede the movement if misplaced (as shown in the photo above) and cause cracking in the wall.

We need to make sure that the anchor is properly placed in the wall so that the tie wire are able to accommodate the up & down movement.

**All it takes is a little effort in the placement of the anchor and wire tie.**
