

The installation of exterior sheathing is critical; many contractors rely on the proper installation of the sheathing for their installations.

Make sure that corners are square & overlap.  
There should NOT be a gap.  
*AVB must always be supported...*  
*(and sheathing should never rest on the concrete)*

This is a photo of the AVB installation at the corner (photo to the left)...  
As you could see, there is a gap in the AVB due to the sheathing installation.

Nice Installation of the sheathing corner

Poor Installation of the sheathing corner

This is a good example of a sheathing corner. The two pieces overlap at the corner and will allow for a proper AVB installation.
