

When installing Millwork overhead, we need to confirm the type of clip being used is specifically for ceiling / OVERHEAD installations.

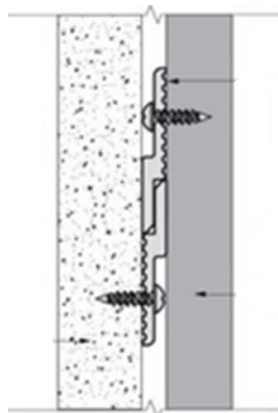

This is a typical interlocking clip that is used for the ceiling/overhead attachment

The ceiling / overhead attachment does not allow for lateral movement and is designed and engineered for horizontal orientation of installation

Keep in mind that this clip is thicker and needs more room – coordinate early.

There are several different types that could be used for this application. Please review this bulletin with the Millworker and have them provide the clips being used to the Quality Department for coordination.

This is a typical Z-clip that is used for the wall attachments
