

Typically, in curtain-wall installations, the Contractor will install units on clips attached to the main structure. These clips are typically aluminum and our structure is typically steel or concrete...both structure materials need to be separated from the aluminum curtain wall system. *(as discussed in several previous Quality Bulletins)*

Also, it is very important that the shims they use to separate the two materials are FULL DEPTH (of clip) and SOLID around the fastener.

The installers are typically very good about this installation, however, every now and again, we run across a missed connection. Please take the time to discuss the requirements with your contractor and review each clip while making your rounds.
